# SONOTRONICS

SURsoft communications software and data processing center

SURsoft is proprietary software designed by Sonotronics for interfacing with SUR submersible ultrasonic receivers. This software was created to enhance the capabilities of the SUR and increase the productivity of the overall SUR system. SURsoft allows you to download records, erase memory, set time and date, and configure a number of settings bringing out the flexibility of the SUR system.

SURsoft data processing center is a new addition to the SURsoft software package. The DPC allows the user to instantaneously sort data from SUR output files, automatically calculate telemetry from transmitters, receive statistics about fish detections, and view a graphic display showing the activity at an SUR. The graphic results can be exported as a bitmap file and used in presentations, etc.
